Project Title

QR Code-Based Footprinting and Information Gathering for Cybersecurity

1. What information can you collect?

When someone scans a QR code that opens a webpage which contains news about Drought Awareness meanwhile in the backend we get the information about the person details availability depends on the webpage, browser, device, and permissions granted.

Information	Can you collect it?	Explanation
Public IP address	Usually, yes	Your web server or hosting provider can typically see the IP address making the request.
Approximate location	Sometimes	An IP address may provide an approximate city or region, but it is not reliably the person's exact location.
Latitude and longitude	Only with permission or another authorized source	A website can request the device's location through the browser's geolocation API. The person must grant permission.
Device type	Often, approximately	Browser information may help identify a phone, tablet, or computer.
Operating system	Sometimes	Browser metadata may provide clues about the operating system, although modern browsers restrict some details.
Browser information	Often, partially	The website may receive browser-related information in the request.
Phone number	No, not automatically	Scanning a QR code does not ordinarily reveal the person's phone number.
IMEI or other hardware identifiers	No, not through a normal webpage	Standard browsers do not expose these identifiers to ordinary websites.
Camera or microphone data	Only with permission and supported functionality	Scanning a QR code does not automatically grant access to either.
